

# Health Professionals' Roles in Environmental Health

Los Angeles | San Francisco

Environmental health is an established practice domain for health professionals. These workshops explore the relationship between human health and our environment, including air (indoor and outdoor), water, food, and products. We will learn how environmental considerations are an important part of health assessments for individuals and communities by health care providers. Join us to understand the multi-disciplinary and multi-agency/sector roles in environmental health, and how they are critical to playing a successful role in protecting individuals and public health.

*Continuing nursing/medical education credits are being pursued for this activity.*
